## INVESTMENT RATIONALE & STRATEGY

### Portfolio Philosophy

This portfolio is built on a Core-Satellite strategy. The core (ETFs 45%) provides stable, diversified market exposure at low cost. The satellite (Indian stocks 35%) captures alpha through India's strongest individual companies. A speculative allocation (crypto 20%) provides asymmetric upside for investors willing to accept higher volatility.

## **A. Indian Stocks (35% = ₹35,000)**

- Reliance Industries (14%): India's largest and most diversified conglomerate. Its Jio telecom network dominates India's digital economy, while Reliance Retail is the country's largest retailer. Q4 FY26 revenue grew 12.9% YoY. Strong long-term compounding story.
- TCS (10.5%): India's top IT exporter earning predominantly in USD. Every rupee of INR depreciation directly boosts reported revenues making TCS a natural hedge against currency weakness. Consistent dividend payer with a 5-year CAGR above 12%.
- Infosys (10.5%): India's 2nd largest IT firm. PE ratio of 15.39x is attractively valued vs sector peers. Offers 4.09% dividend yield and a 3-year ROE of 30.8%. Strong AI services strategy positions it well for the next tech upcycle.

## **B. ETFs (45% = ₹45,000) Core of Portfolio**

- Nippon Nifty 50 BeES / NIFTYBEES (25%): The single largest position. Tracks India's top 50 companies with a minimal expense ratio of 0.03%. Delivered ~11.24% CAGR over 5 years. Provides instant diversification across banking, IT, energy, and consumer sectors.
- SBI Gold ETF (10%): Gold acts as a hedge against inflation and INR depreciation both relevant risks in May 2026 with the rupee near ₹96 per USD. Gold historically

outperforms equities during periods of market stress and geopolitical uncertainty.

- Motilal Oswal Nasdaq 100 ETF (10%): Provides exposure to the world's top technology companies (Apple, NVIDIA, Microsoft, Meta, Amazon) through a single Indian rupee instrument. Additionally benefits from USD/INR appreciation.

### **C. Cryptocurrencies (20% = ₹20,000) Satellite / High Growth**

- Bitcoin / BTC (12%): Largest allocation within crypto. BTC is the most institutionally accepted digital asset, with spot ETFs approved in the US and corporate treasury adoption growing. Currently -38.9% from its October 2025 ATH of \$126,073 a potential re-entry opportunity.
- Ethereum / ETH (5%): The leading smart contract blockchain with \$9B+ in corporate treasury holdings. The Glamsterdam protocol upgrade targeting mid-2026 is the next major catalyst. Currently -58.4% from ATH.
- Solana / SOL (3%): Smallest and most speculative position. Solana's AI agent ecosystem and Wall Street payment rail adoption are early but promising signals. Spot ETFs have crossed \$1B AUM. Highest risk but highest potential upside if the bull cycle resumes.

### **RISK ASSESSMENT & DISCLAIMER**

| Risk Factor                    | Level            | Mitigation                                                      |
|--------------------------------|------------------|-----------------------------------------------------------------|
| <b>Market Risk (Equity)</b>    | Medium           | ETF allocation (45%) provides broad diversification             |
| <b>Currency Risk (INR/USD)</b> | Medium           | USD-earning stocks (TCS, Infosys) + Nasdaq ETF as natural hedge |
| <b>Crypto Volatility</b>       | <b>Very High</b> | Limited to 20% of portfolio capped downside exposure            |
| <b>Concentration Risk</b>      | Low<br>Medium    | 9 instruments across 3 asset classes and 5 sectors              |
| <b>Liquidity Risk</b>          | <b>Low</b>       | All instruments are listed on NSE/BSE or major crypto exchanges |
| <b>Inflation Risk</b>          | Low<br>Medium    | Gold ETF (10%) provides inflation protection                    |
